Core Stack: C# · .NET / .NET Core · ASP.NET Core · Entity Framework · Clean Architecture · Azure (Service Bus, API Management, DevOps) · SQL Server

PROFESSIONAL SUMMARY

Senior .NET backend engineer with 8+ years building mission-critical enterprise systems, integrations, and AI-assisted development pipelines across a software factory, the fuel industry, and — currently — grain brokerage.

Specializes in systems where a calculation error isn't a bug — it's money: go-to engineer for key subsystems — contracts, commissions, billing, and integrations — on a platform in production since 2016, used by 47 active users and integrated with 20+ external systems.

Over the past year, championed the adoption of AI-assisted development company-wide: built 17 internal tools that cut full CRUD implementation time from 10 hours to 20 minutes, now actively used across multiple engineering teams.

CORE SKILLS

Backend & .NET: C#, .NET, .NET Core, ASP.NET Core, ASP.NET MVC, Entity Framework, EF Core, WCF

Architecture: Clean Architecture, IoC (Inversion of Control), Repository Pattern, enterprise systems design

Integrations: REST, Azure Service Bus, Azure API Management, external system integrations

Databases: SQL Server

Testing: MSTest (Unit Testing)

Cloud & DevOps: Microsoft Azure, Azure DevOps, Git

Desktop & Mobile: WinForms, WPF, Xamarin, MVVM

Frontend: JavaScript, jQuery, Ajax

Other: VB.NET, RFID

Languages: Spanish (native); English (fluent technical reading/writing, working proficiency in spoken conversation)

PROFESSIONAL EXPERIENCE

.NET Developer — fyo

October 2021 – Present

Rosario, Argentina

Critical Systems

- Serve as the go-to engineer for several subsystems of a mission-critical grain brokerage platform — contracts, commissions, billing, and integrations — keeping all of them built on Clean Architecture principles. The platform has been in production since 2016, is used by 47 active users, integrates with 20+ external systems (AFIP, BCR, arbitration chambers, multinational clients, and trading partners), and has issued over 1 million transaction records to date.
- Built the communication layer for the Order Management module (price Deviations and Fixings), integrating it with Azure Service Bus (owned by the Integrations team) to keep data in sync in real time between platforms. Year-to-date 2026, this eliminated duplicate manual entry for 1,125 Deviations and 5,263 Fixings — an estimated **689 hours** of manual work saved.
- Designed and built the automated invoicing pipeline for drying services, running daily calculations through complex algorithms; has issued over **800 invoices** automatically, with zero manual input from the user.
- Built the cross-platform sync for economic groups.
- Write and maintain unit tests (MSTest) as part of daily workflow to protect the business logic behind these critical subsystems.
- Share end-to-end ownership of the system's uptime and correct behavior with one other developer; take part in roughly two production deployments a week within a semi-automated process.

AI-Assisted Development

- Championed AI-assisted development company-wide, taking it from a personal initiative to official policy: wrote the supporting documentation, self-funded the pilot, and trained developers across other teams and roles.
- Built **17 AI-powered tools** (Claude Code) that automate repetitive development work — including a full CRUD feature that went from 10 hours to 20 minutes — freeing up time for higher-value problem-solving; now actively used by 7 developers across 3 different teams, including two architects.
- Adopted Spec-Driven Development (SDD) as a methodology to structure and speed up AI-assisted development.
- Stack: C#, .NET Framework, .NET Core, Entity Framework, EF Core, WCF, ASP.NET MVC, WinForms, WPF, SQL Server, Azure Service Bus, Azure API Management, Azure DevOps, Git, MSTest, Claude Code.

.NET Developer — DataOil SRL

August 2019 – October 2021 (2 yrs 3 mo)

Rosario, Argentina

- Designed and built the integration between fuel dispensers and the gas station's management system, enabling dispatch through RFID wristbands assigned to each employee — giving the owner precise visibility into where every liter of fuel went and who dispensed it.
- Built the integration between the stations' management system and the YPF mobile app.
- Developed and maintained desktop applications, Windows Services, Web Services, and APIs across different areas of the business, including integrations with external vendors and third-party solutions.
- Stack: VB.NET, C#, ASP.NET Core, MVC Core, JavaScript/jQuery/Ajax, WPF, Xamarin, Entity Framework Core, SQL Server 2014, MVVM.

.NET Developer — GT-Sistemas

January 2018 – July 2019 (1 yr 7 mo)

Rosario, Argentina

- Took part in analyzing, designing, and building new systems and enhancements to existing ones, including end-user rollout, training, and support.
- Stack: VB.NET, MSSQL Server 2008 R2, WinForms.

EDUCATION

Tecnicatura Superior en Desarrollo de Software (Systems) — Terciario Urquiza, 2018–2020

Tecnicatura en Reparación de PC y Redes — Instituto Técnico del Oficio Rivadavia, 2017
